

Dataset Explanation

The project operates on real-time textual input provided by users through an interactive interface. Rather than relying on a preloaded dataset, the application treats each user submission as unique, dynamic input that drives slide generation.

To meet the dataset submission requirement, a simulated dataset has been created to represent user input. This input follows a structured format and is saved as a `.txt` file. It is also included in a `.zip` archive for submission purposes.

1. Data Source & Data Link

- **Source:** Simulated user input (manually constructed)
- **Link:** *This is a custom text file created for demonstration and is included in the submitted ZIP.*

2. Libraries Required for the Project

- `python-pptx` – for creating and formatting PowerPoint slides
- `ipywidgets` – for creating an interactive user interface in Google Colab
- `datetime` – for generating unique filenames based on timestamps
- `google.colab.files` – for enabling file downloads

Example Dataset (sample_input.txt):

```
Future of Work
Automation increases
Humans focus on strategy
New jobs emerge

AI in Education
Personalized learning
AI tutors
Automated grading
```

This structure mimics the manual input a user would provide through the interface. The system reads and processes this text format to produce a fully styled presentation, making it adaptable and data-agnostic in design.
