

Abstract

This project introduces an AI-driven tool that transforms plain text into professional PowerPoint presentations. Implemented using Python in Google Colab, it leverages the `python-pptx` library and an interactive interface powered by `ipywidgets`. Users input content in natural language, which the system structures into slide titles and formatted bullet points or paragraphs. Aesthetic features like gradient backgrounds and smart line-wrapping ensure clarity and consistency. This intuitive workflow eliminates manual slide creation, making it highly efficient for students, educators, and professionals seeking fast, polished presentation output.
